#### **Outline**

PS11, Ex. 1 (A): Effect of the GED education as a signal

PS11, Ex. 2 (A): Asymmetric information (PBE)

Signaling games in general

PS11, Ex. 3: Signaling game (pooling and separating PBE)

PS11, Ex. 4: Signaling games (pooling and separating PBE)

PS11, Ex. 5: Signaling games (pooling PBE)

PS11, Ex. 6: Spence's education signaling model (PBE)

1

# PS11, Ex. 1 (A): Effect of the GED education as a signal

## PS11, Ex. 1 (A): Effect of the GED education as a signal

Does signaling work? Read the article by Tyler, Murnane and Willett and think about their results. What is their hypothesis for why they do not find an effect for minority groups? Come up with an example of an education program that has mostly signaling value in your country.

(This is a reflection question, no answer will be provided).

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

Step 1: Consider the uniform distribution  $x \sim U(a,b)$ . Use the cumulative distribution function (CDF) to write up the probability that a random draw of x is lower than a constant c. Use the mean to write up the expected value of a random draw of x where x is lower than a constant  $c \in [a,b]$ .

4

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

- Step 1: Consider the uniform distribution  $x \sim U(a,b)$ . Use the cumulative distribution function (CDF) to write up the probability that a random draw of x is lower than a constant c. Use the mean to write up the expected value of a random draw of x where x is lower than a constant  $c \in [a,b]$ .
- 1. Standard results for  $x \sim U(a, b)$ :

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡)

5

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

- Step 1: Consider the uniform distribution  $x \sim U(a,b)$ . Use the cumulative distribution function (CDF) to write up the probability that a random draw of x is lower than a constant c. Use the mean to write up the expected value of a random draw of x where x is lower than a constant  $c \in [a,b]$ .
- Step 2: The buyer offers a price p. Write up the seller's strategy (best response).

1. Standard results for  $x \sim U(a, b)$ :

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡)

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

- Step 1: Consider the uniform distribution  $x \sim U(a,b)$ . Use the cumulative distribution function (CDF) to write up the probability that a random draw of x is lower than a constant c. Use the mean to write up the expected value of a random draw of x where x is lower than a constant  $c \in [a,b]$ .
- Step 2: The buyer offers a price *p*. Write up the seller's strategy (best response).

1. Standard results for  $x \sim U(a, b)$ :

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡

2. 
$$S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$$

7

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

- Step 1: Consider the uniform distribution  $x \sim U(a,b)$ . Use the cumulative distribution function (CDF) to write up the probability that a random draw of x is lower than a constant c. Use the mean to write up the expected value of a random draw of x where x is lower than a constant  $c \in [a,b]$ .
- Step 2: The buyer offers a price *p*. Write up the seller's strategy (best response).
- Step 3: Write up the buyer's problem.

1. Standard results for  $x \sim U(a, b)$ :

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡

2. 
$$S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$$

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

- Step 1: Consider the uniform distribution  $x \sim U(a,b)$ . Use the cumulative distribution function (CDF) to write up the probability that a random draw of x is lower than a constant c. Use the mean to write up the expected value of a random draw of x where x is lower than a constant  $c \in [a,b]$ .
- Step 2: The buyer offers a price *p*. Write up the seller's strategy (best response).
- Step 3: Write up the buyer's problem:  $\max_{p} \mathbb{P}[v_s < p] \mathbb{E}[v_b p | v_s < p]$

1. Standard results for  $x \sim U(a, b)$ :

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡

2. 
$$S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$$

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

Step 1: Use the CDF to write up 
$$\mathbb{P}(x < c)$$
. 1. Standard results for  $x \sim U(a, b)$ :

Use the mean to write up  $\mathbb{E}(x < c)$ . CDF:  $F(x) = \frac{x-a}{b-2} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-2}$  (†)

Step 2: The buyer offers a price 
$$p$$
. Write up the seller's strategy (best response). Mean:  $\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$  (‡

Step 3: Write up the buyer's problem:
$$\max_{p} \mathbb{P}[v_s < p] \mathbb{E}[v_b - p | v_s < p]$$

$$= \max_{p} \frac{p - 0}{1 - 0} \mathbb{E}[kv_s - p | v_s < p]$$

$$= \max_{p} p \left(k \mathbb{E}[v_s < p] - p\right)$$

$$= \max_{p} p \left(k \mathbb{E}[v_s < p] - p\right)$$

$$= \max_{p} p \left(k \frac{0 + p}{2} - p\right)$$
using (†)
$$using (†)$$

$$using (†)$$

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

Step 1: Use the CDF to write up 
$$\mathbb{P}(x < c)$$
. 1. Standard results for  $x \sim U(a, b)$ :

Use the mean to write up  $\mathbb{E}(x < c)$ . CDF:  $F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$  (†)

Step 2: The buyer offers a price p. Write up the seller's strategy (best response). Mean:  $\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$  (‡

the seller's strategy (best response). Heath 
$$p = 2$$
 to the seller's strategy (best response). Step 3: Write up the buyer's problem: 
$$\max_{p} \mathbb{P}[v_s < p] \mathbb{E}[v_b - p | v_s < p] \qquad 2. S_s(p, v_s) = \begin{cases} Sell & \text{if } p \geq v_s \\ Don't & \text{if } p < v_s \end{cases}$$
$$= \max_{p} \frac{p - 0}{1 - 0} \mathbb{E}[kv_s - p | v_s < p] \qquad \text{using (†)} \qquad 3. \max_{p} u_b(p, k) = \max_{p} p^2 \left(\frac{k}{2} - 1\right)$$
$$= \max_{p} p \left(k \mathbb{E}[v_s < p] - p\right)$$
$$= \max_{p} p \left(k \frac{0 + p}{2} - p\right) \qquad \text{using (†)}$$

Step 4: Take the first-order condition.

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

- Step 1: Use the CDF to write up  $\mathbb{P}(x < c)$ . Use the mean to write up  $\mathbb{E}(x < c)$ .
- Step 2: The buyer offers a price *p*. Write up the seller's strategy (best response).
- Step 3: Write up the buyer's problem.
- Step 4: Take the first-order condition:

$$\frac{\delta u_b(p,k)}{\delta p} = 0$$

$$2p\left(\frac{k}{2} - 1\right) = 0$$

$$2p\frac{k}{2} = 2p$$

$$p\frac{k}{2} = p$$

- 1. Standard results for  $x \sim U(a, b)$ :
- CDF:  $F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$  (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡

2. 
$$S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$$

3. 
$$\max_{p} u_b(p, k) = \max_{p} p^2 \left(\frac{k}{2} - 1\right)$$

4. FOC: 
$$p^{\frac{k}{2}} = p$$

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

Step 1: Use the CDF to write up 
$$\mathbb{P}(x < c)$$
. Use the mean to write up  $\mathbb{E}(x < c)$ .

1. Standard results for  $x \sim U(a, b)$ : CDF:  $F(x) = \frac{x-a}{b-2} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-2}$  (†)

Step 2: The buyer offers a price 
$$p$$
. Write up Mean:  $\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$  (‡) the seller's strategy (best response).

Step 3: Write up the buyer's problem.

2.  $S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$ 

Step 4: Take the first-order condition.

3. 
$$\max_{p} u_b(p, k) = \max_{p} p^2 \left(\frac{k}{2} - 1\right)$$

Step 5: Maximize buyer's utility for k < 2.

4. FOC: 
$$p^{\frac{k}{2}} = p$$

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

Step 1: Use the CDF to write up 
$$\mathbb{P}(x < c)$$
. Use the mean to write up  $\mathbb{E}(x < c)$ .

1. Standard results for 
$$x \sim U(a, b)$$
:

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)  
Mean:  $\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$  (‡)

Step 3: Write up the buyer's problem.

Step 4: Take the first-order condition.

2. 
$$S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$$

Step 5: Maximize buyer's utility for k < 2.

3. 
$$\max_{p} u_b(p, k) = \max_{p} p^2 \left(\frac{k}{2} - 1\right)$$

Step 6: Maximize buyer's utility for k > 2.

4. FOC: 
$$p^{\frac{k}{2}} = p$$

5. For 
$$k \in (1,2)$$
:  $p \frac{k}{2}$ 

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

Step 1: Use the CDF to write up 
$$\mathbb{P}(x < c)$$
. Use the mean to write up  $\mathbb{E}(x < c)$ .

Step 2: The buyer offers a price *p*. Write up the seller's strategy (best response).

Step 3: Write up the buyer's problem.

Step 4: Take the first-order condition.

Step 5: Maximize buyer's utility for k < 2.

Step 6: Maximize buyer's utility for k > 2.

Step 7: Looking at the seller's strategy, will trade occur when k > 2?
What about  $k \in (1,2)$ ? Have we seen something similar before?

1. Standard results for 
$$x \sim U(a, b)$$
:

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡)

2. 
$$S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$$

3. 
$$\max_{p} u_b(p, k) = \max_{p} p^2 \left(\frac{k}{2} - 1\right)$$

4. FOC: 
$$p^{\frac{k}{2}} = p$$

5. For 
$$k \in (1,2)$$
:  $p^{\frac{k}{2}}$ 

6. For 
$$k > 2 : p \frac{k}{2} > p \Rightarrow p^{**} = 1$$

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

Step 1: Use the CDF to write up 
$$\mathbb{P}(x < c)$$
. Use the mean to write up  $\mathbb{E}(x < c)$ .

Step 3: Write up the buyer's problem.

Step 4: Take the first-order condition.

Step 5: Maximize buyer's utility for k < 2.

Step 6: Maximize buyer's utility for k > 2.

Step 7: k > 2: As  $v_s \in [0,1] \le 1 = p^{**}$ , seller will always accept this price. What about  $k \in (1,2)$ ? Have we seen something similar before?

1. Standard results for 
$$x \sim U(a, b)$$
:

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡)

2. 
$$S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$$

3. 
$$\max_{p} u_b(p, k) = \max_{p} p^2 \left(\frac{k}{2} - 1\right)$$

4. FOC: 
$$p^{\frac{k}{2}} = p$$

5. For 
$$k \in (1,2)$$
:  $p^{\frac{k}{2}}$ 

6. For 
$$k > 2 : p \frac{k}{2} > p \Rightarrow p^{**} = 1$$

Exercise 4.11 in Gibbons (p. 250). Difficult. A buyer and a seller have valuations  $v_b$  and  $v_s$ . It is common knowledge that there are gains from trade (i.e., that  $v_b > v_s$ ), but the size of the gains is private information, as follows: the seller's valuation is uniformly distributed on [0,1]; the buyer's valuation  $v_b = kv_s$ , where k > 1 is common knowledge; the seller knows  $v_s$  (and hence  $v_b$ ) but the buyer does not know  $v_b$  (and hence  $v_s$ ). Suppose the buyer makes a single offer, p, which the seller either accepts or rejects. What is the perfect Bayesian equilibrium when k < 2? When k > 2? (See Samuelson 1984.)

- Step 1: Use the CDF to write up  $\mathbb{P}(x < c)$ . Use the mean to write up  $\mathbb{E}(x < c)$ .
- Step 2: The buyer offers a price *p*. Write up the seller's strategy (best response).
- Step 3: Write up the buyer's problem.
- Step 4: Take the first-order condition. Step 5: Maximize buyer's utility for k < 2.
- Stop 6: Maximize buyer's utility for k < 2
- Step 6: Maximize buyer's utility for k > 2. Step 7: k > 2: As  $y \in [0, 1] < 1 - p^{**}$
- Step 7: k > 2: As  $v_s \in [0,1] \le 1 = p^{**}$ , seller will always accept this price.  $k \in (1,2)$ : Seller will not accept if  $v_s > 0$ , though trade would benefit both under perfect information. Similar to Akerlof's 'Lemons'.

1. Standard results for  $x \sim U(a, b)$ :

CDF: 
$$F(x) = \frac{x-a}{b-a} \Rightarrow \mathbb{P}(x < c) = \frac{c-a}{b-a}$$
 (†)

Mean: 
$$\mu = \frac{a+b}{2} \Rightarrow \mathbb{E}(x < c) = \frac{a+c}{2}$$
 (‡

2. 
$$S_s(p, v_s) = \begin{cases} Sell & \text{if } p \ge v_s \\ Don't & \text{if } p < v_s \end{cases}$$

3. 
$$\max_{p} u_b(p, k) = \max_{p} p^2 \left(\frac{k}{2} - 1\right)$$

4. FOC: 
$$p \frac{k}{2} = p$$

5. For 
$$k \in (1,2)$$
:  $p^{\frac{k}{2}}$ 

6. For 
$$k > 2$$
:  $p \frac{k}{2} > p \Rightarrow p^{**} = 1$ 

Signaling games in general

### PS11: Signaling games in general

#### Players:

 2 players: Sender (S) and receiver (R). E.g. firm and consumer, or employer and employee (Spence).

#### Timing:

- 1. Nature chooses the sender's type from  $T = \{t_1, ...\}$ .
- 2. S: The sender realizes her type and sends a signal from  $M = \{m_1, ...\}$ , typically either L (left) or R (right).
- R: The receiver observes m (but not the type t!) and forms his beliefs:
   μ(t<sub>1</sub>|L) = p and μ(t<sub>1</sub>|R) = q
   Consequently, for S having two possible types:

$$\mu(t_2|L) = 1 - p$$
 and  $\mu(t_2|R) = 1 - q$ 

- 4. R: The receiver chooses an action from  $A = \{a_1, ...\}$ , e.g. up or down.
- 5. Payoffs are realized.

# PS11: Signaling games in general

Players:

 2 players: Sender (S) and receiver (R). E.g. firm and consumer, or employer and employee (Spence).

Timing:

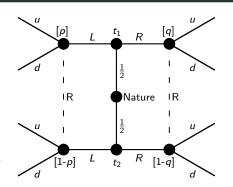

- 1. Nature chooses the sender's type from  $T = \{t_1, ...\}$ .
- 2. S: The sender realizes her type and sends a signal from  $M = \{m_1, ...\}$ , typically either L (left) or R (right).
- 3. R: The receiver observes m (but not the type t!) and forms his beliefs:  $p = \mu(t_1|L) \text{ and } q = \mu(t_1|R)$  Consequently, for S having two possible types:

$$1-p=\mu(t_2|L)$$
 and  $1-q=\mu(t_2|R)$ 

- 4. R: The receiver chooses an action from  $A = \{a_1, ...\}$ , e.g. up or down.
- 5. Payoffs are realized.

#### Four possible equilibria for two types:

- Pooling on L or pooling on R.
- Separating: t<sub>1</sub> plays L and t<sub>2</sub> plays R or the other way around.

# PS11: Signaling games in general

#### Players:

 2 players: Sender (S) and receiver (R). E.g. firm and consumer, or employer and employee (Spence).

#### Timing:

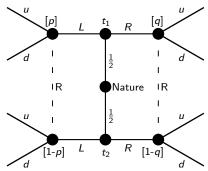

- 1. Nature chooses the sender's type from  $T = \{t_1, ...\}$ .
- 2. S: The sender realizes her type and sends a signal from  $M = \{m_1, ...\}$ , typically either L (left) or R (right).

   p = μ(t<sub>1</sub>|L) and q = μ(t<sub>1</sub>|R)
   Consequently, for S having two possible types:

$$1-p=\mu(t_2|L)$$
 and  $1-q=\mu(t_2|R)$ 

- 4. R: The receiver chooses an action from  $A = \{a_1, ...\}$ , e.g. up or down.
- 5. Payoffs are realized.

## Four possible equilibria for two types:

- Pooling on L or pooling on R.
- Separating: t<sub>1</sub> plays L and t<sub>2</sub> plays R or the other way around.

Cookbook: For each possible equilibrium go over signaling requirements 3 and 2:

SR3: R: Find the beliefs p,q given S's eq. strategy. (Only consider beliefs that are consistent with S's eq. strategy.)

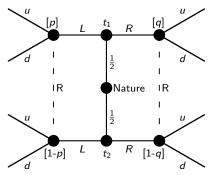

SR2R: R: Given beliefs, find  $a(m_j|\mu(t_1|m_j))$ .

SR2S: S: Does  $t_1$  or  $t_2$  want to deviate?

PBE: No deviation  $\rightarrow$  PBE. Pooling on L: Find off-eq.  $a(R|q) \rightarrow$  possibly two different PBE for different q.

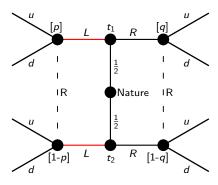

Consider the signaling game in Figure 1.

- (a) Suppose there is a pooling PBE where the Sender sends message *L* regardless of his type. What are the beliefs in this equilibrium?
- (b) Consider a possible separating PBE where  $t_1$  sends message R,  $t_2$  sends message L, and where the receiver chooses u if and only if he receives message L. Can you write down payoffs for this game such that nobody has an incentive to deviate?

(a) Suppose there is a pooling PBE where the Sender sends message *L* regardless of his type. What are the beliefs in this equilibrium?

SR3: R: Find the beliefs of R given S's equilibrium strategy. (In equilibrium, we only consider beliefs of R that are consistent with S's equilibrium strategy.)

- (a) Suppose there is a pooling PBE where the Sender sends message *L* regardless of his type. What are the beliefs in this equilibrium?
- SR3: R: Find the beliefs of R given S's equilibrium strategy. (In equilibrium, we only consider beliefs of R that are consistent with S's eq. strategy.):

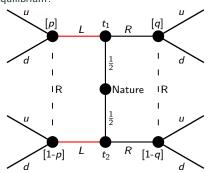

$$\mu(t_1|L) = \mu(t_2|L) = \frac{1}{2}$$

$$\Rightarrow p = 1 - p = \frac{1}{2}$$

$$q \in [0; 1]$$

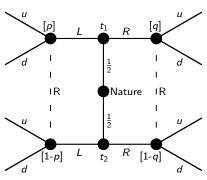

I.e. in a pooling perfect Bayesian equilibrium where S always sends the message L, the receiver R believes that S can be type  $t_1$  or  $t_2$  with equal probability as the signal does not reveal anything.

As the message R is not a part of S's equilibrium strategy, the receiver R has no beliefs about q other than  $q \in [0,1]$  in the case where S would unexpectedly send the message R instead.

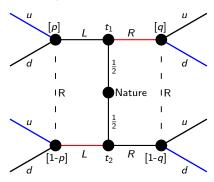

(b) Consider a possible separating PBE where  $t_1$  sends message R,  $t_2$  sends message L, and where the receiver chooses u if and only if he receives message L. Can you write down payoffs for this game such that nobody has an incentive to deviate?

SR3:

(b) Consider a possible separating PBE where  $t_1$  sends message R,  $t_2$  sends message L, and where the receiver chooses u if and only if he receives message L. Can you write down payoffs for this game such that nobody has an incentive to deviate?

SR3: R: Find the beliefs of R given S's equilibrium strategy. (In equilibrium, we only consider beliefs of R that are consistent with S's equilibrium strategy.)

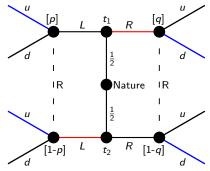

(b) Consider a possible separating PBE where  $t_1$  sends message R,  $t_2$  sends message L, and where the receiver chooses u if and only if he receives message L. Can you write down payoffs for this game such that nobody has an incentive to deviate?

$$\left\{ \begin{array}{l} (R,R), (u,u), p \geq \frac{1}{2}, q = \frac{1}{2} \\ (R,R), (d,u), p \leq \frac{1}{2}, q = \frac{1}{2} \end{array} \right\}$$

Exercise 4.4.a in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

- Step 1: Write up S's possible strategies.
- Step 2: For the pooling strategy (L,L), go over SR3. SR2R. and SR2S.
- Step 3: For the pooling strategy (R,R), go over SR3. SR2R. and SR2S.
- Step 4: For the separating strategy (L,R), go over SR3. SR2R, and SR2S.

- 1.  $S_S = \{(L, L); (R, R); (L, R); (R, L)\}$
- 2. No PBE that includes (L, L).
- 3.  $\left\{ \begin{array}{l} (R,R), (u,u), p \geq \frac{1}{2}, q = \frac{1}{2} \\ (R,R), (d,u), p \leq \frac{1}{2}, q = \frac{1}{2} \end{array} \right\}$

Exercise 4.4.a in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

- Step 1: Write up S's possible strategies.
- Step 2: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S.
- Step 3: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S.
- Step 4: For the separating strategy (L,R), go over SR3. SR2R, and SR2S:
  - SR3: R: Beliefs given S's eq. strategy:

$$\mu(t_1|L)=p=1$$
 and  $\mu(t_1|R)=q=0$ 

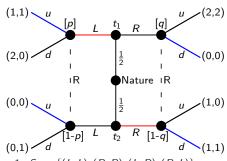

- SR2R: R: Best response is to play u|L, d|R.
- SR2S:  $t_1$  will not deviate as

$$u_{S}(L, u|t_{1}) = 1 > 0 = u_{S}(R, d|t_{1})$$

t<sub>2</sub> will not deviate as

$$u_{S}(R, d|t_{2}) = 1 > 0 = u_{S}(L, u|t_{2})$$

PBE: No deviation, thus, it's a PBE.

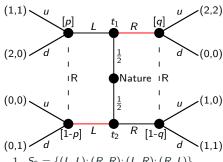

- 1.  $S_S = \{(L, L); (R, R); (L, R); (R, L)\}$
- 2. No PBE that includes (L, L).

3. 
$$\left\{ \begin{array}{l} (R,R), (u,u), p \geq \frac{1}{2}, q = \frac{1}{2} \\ (R,R), (d,u), p \leq \frac{1}{2}, q = \frac{1}{2} \end{array} \right\}$$

4. 
$$\{ (L,R), (u,d), p=1, q=0 \}$$

Exercise 4.4.a in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

- Step 1: Write up S's possible strategies.
- Step 2: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S,
- Step 3: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S.
- Step 4: For the separating strategy (L,R), go over SR3, SR2R, and SR2S.
- Step 5: For the separating strategy (R,L), go over SR3, SR2R, and SR2S.

- 1.  $S_S = \{(L, L); (R, R); (L, R); (R, L)\}$
- 2. No PBE that includes (L, L).

3. 
$$\left\{ \begin{array}{l} (R,R), (u,u), p \geq \frac{1}{2}, q = \frac{1}{2} \\ (R,R), (d,u), p \leq \frac{1}{2}, q = \frac{1}{2} \end{array} \right\}$$

4. 
$$\{(L,R),(u,d),p=1,q=0\}$$

Exercise 4.4.a in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

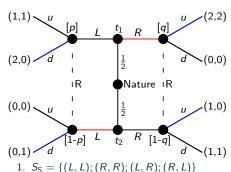

- Step 1: Write up S's possible strategies.
- Step 2: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S.
- Step 3: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S.
- Step 4: For the separating strategy (L,R), go over SR3. SR2R, and SR2S.
- Step 5: For the separating strategy (R,L), go over SR3, SR2R, and SR2S:
  - SR3: R: Beliefs given S's eq. strategy:

$$\mu(t_1|L)=p=0$$
 and  $\mu(t_1|R)=q=1$ 

- SR2R: R: Best response is to play d|L, u|R.
- SR2S: t2 wants to deviate as

$$u_{S}(L, d|t_{2}) = 0 < 1 = u_{S}(R, u|t_{2})$$

- PBE: No PBE as  $t_2$  will want to deviate.
- Step 6: Write up the full set of PBE.

- 2. No PBE that includes (L, L).
- 2. No PBE that includes (L, L).

3. 
$$\left\{ \begin{array}{l} (R,R), (u,u), p \geq \frac{1}{2}, q = \frac{1}{2} \\ (R,R), (d,u), p \leq \frac{1}{2}, q = \frac{1}{2} \end{array} \right\}$$

- 4.  $\{ (L,R), (u,d), p=1, q=0 \}$
- 5. No PBE that includes (R, L).

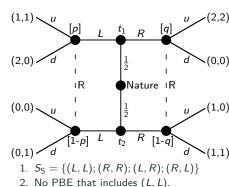

Exercise 4.4.a in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Step 1: Write up S's possible strategies.Step 2: For the pooling strategy (*L,L*), go over SR3. SR2R. and SR2S.

Step 3: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S. Step 4: For the separating strategy (L,R), go

over SR3, SR2R, and SR2S. Step 5: For the separating strategy (R,L), go over SR3, SR2R, and SR2S:

Step 6: Write up the full set of PBE.

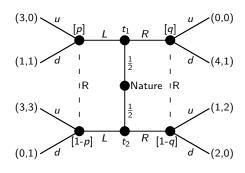

3.  $\left\{ \begin{array}{l} (R,R), (u,u), p \geq \frac{1}{2}, q = \frac{1}{2} \\ (R,R), (d,u), p \leq \frac{1}{2}, q = \frac{1}{2} \end{array} \right\}$ 4.  $\left\{ \begin{array}{l} (L,R), (u,d), p = 1, q = 0 \end{array} \right\}$ 

5. No PBE that includes (R, L).  $(R, R), (u, u), p \ge \frac{1}{2}, q = \frac{1}{2}$   $(R, R), (d, u), p \le \frac{1}{2}, q = \frac{1}{2}$  (L, R), (u, d), p = 1, q = 0

Q

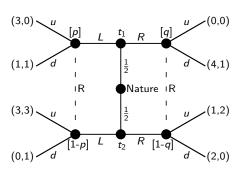

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

• Consider S's possible strategies:

$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

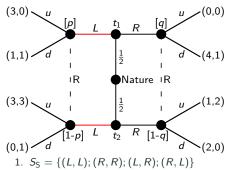

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S.

1. 
$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_{S} = \{(L, L); (R, R); (L, R); (R, L)\}$$

Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S:

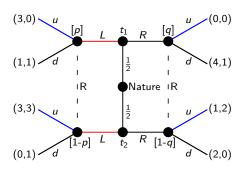

SR3: R: Beliefs given S's eq. strategy:

$$\mu(t_1|L) = p = \frac{1}{2} \text{ and } \mu(t_1|R) = q \in [0,1]$$

SR2R: R: Best response is to play u|L as  $\mathbb{E}[u_R(L, u|p=\frac{1}{2})] = 0\frac{1}{2} + 3\frac{1}{2} = \frac{3}{2}$   $\mathbb{E}[u_R(L, d|p=\frac{1}{2})] = 1\frac{1}{2} + 1\frac{1}{2} = 1$ 

SR2S:  $t_1, t_2$  will not deviate if R plays u|R.

PBE: So, now what?

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

• Consider S's possible strategies:  $S_S = \{(L, L); (R, R); (L, R); (R, L)\}$ 

Step 1: For the pooling strategy 
$$(L,L)$$
, go over SR3, SR2R, and SR2S:

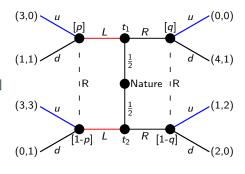

SR3: R: Beliefs given S's eq. strategy:

$$\mu(t_1|L)=p=rac{1}{2}$$
 and  $\mu(t_1|R)=q\in[0,1]$ 

SR2R: R: Best response is to play u|L as  $\mathbb{E}[u_{R}(L, u|p=\frac{1}{2})] = 0\frac{1}{2} + 3\frac{1}{2} = \frac{3}{2}$   $\mathbb{E}[u_{R}(L, d|p=\frac{1}{2})] = 1\frac{1}{2} + 1\frac{1}{2} = 1$ 

SR2S:  $t_1, t_2$  will not deviate if R plays u|R.

PBE: Find values of q such that the receiver plays u|R.

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_{S} = \{(L, L); (R, R); (L, R); (R, L)\}$$

Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S:

SR3: R: Beliefs given S's eq. strategy:

$$\mu(t_1|L)=p=rac{1}{2}$$
 and  $\mu(t_1|R)=q\in[0,1]$ 

SR2R: R: Best response is to play u|L as  $\mathbb{E}[u_R(L, u|p=\frac{1}{2})] = 0\frac{1}{2} + 3\frac{1}{2} = \frac{3}{2}$   $\mathbb{E}[u_R(L, d|p=\frac{1}{2})] = 1\frac{1}{2} + 1\frac{1}{2} = 1$ 

SR2S:  $t_1, t_2$  will not deviate if R plays u|R.

PBE: Find values of q such that the receiver plays u|R:

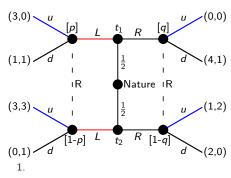

$$\mathbb{E}[u_{\mathsf{R}}(R,u|q) \geq \mathbb{E}[u_{\mathsf{R}}(R,d|q)$$

$$0q + 2[1-q] \ge 1q + 0[1-q]$$

$$2-2q \geq q$$

$$2 \ge 3q$$

$$\frac{2}{3} \geq q$$

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S:

SR3: R: Beliefs given S's eq. strategy:

$$\mu(t_1|L) = p = \frac{1}{2} \text{ and } \mu(t_1|R) = q \in [0,1]$$

SR2R: R: Best response is to play 
$$u|L$$
 as  $\mathbb{E}[u_R(L, u|p=\frac{1}{2})] = 0\frac{1}{2} + 3\frac{1}{2} = \frac{3}{2}$   $\mathbb{E}[u_R(L, d|p=\frac{1}{2})] = 1\frac{1}{2} + 1\frac{1}{2} = 1$ 

SR2S: 
$$t_1, t_2$$
 will not deviate if R plays  $u|R$ .

PBE: Find values of q such that the receiver plays u|R:

$$\mathbb{E}[u_{\mathsf{R}}(R,u|q)\geq\mathbb{E}[u_{\mathsf{R}}(R,d|q)$$

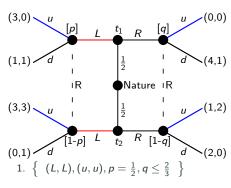

$$0q + 2[1-q] \ge 1q + 0[1-q]$$

$$2-2q \ge q$$

$$2 \ge 3q$$

$$\frac{2}{3} \geq q$$

Write up the PBE including beliefs.

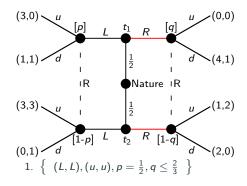

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

- Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S.
- Step 2: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S.

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S.

Step 2: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S:

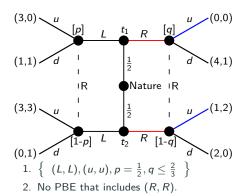

SR3: R: Beliefs given S's eq. strategy:

$$\mu(t_1|L)=p\in[0,1]$$
 and  $\mu(t_1|R)=q=rac{1}{2}$ 

SR2R: R: Best response is to play u as  $\mathbb{E}[u_{R}(R, u|q=\frac{1}{2})] = 0\frac{1}{2} + 2\frac{1}{2} = 1$   $\mathbb{E}[u_{R}(R, d|q=\frac{1}{2})] = 1\frac{1}{2} + 0\frac{1}{2} = \frac{1}{2}$ 

SR2S:  $t_1$  will deviate as the payoff from  $(L, a(L)|t_1)$  is strictly higher than  $(R, u|t_1) = 0$ .

PBE: No PBE, as  $t_1$  wants to deviate.

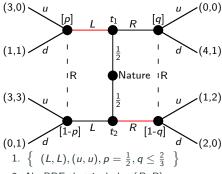

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_{S} = \{(L, L); (R, R); (L, R); (R, L)\}$$

- Step 1: For the pooling strategy (L,L), go over SR3. SR2R. and SR2S.
- Step 2: For the pooling strategy (R,R), go over SR3. SR2R. and SR2S.
- Step 3: For the separating strategy (L,R), go over SR3, SR2R, and SR2S.

- 2. No PBE that includes (R, R).

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

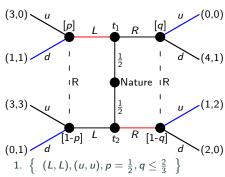

- Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S.
- Step 2: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S.
- Step 3: For the separating strategy (L,R), go over SR3, SR2R, and SR2S:
  - SR3: R: Beliefs given S's eq. strategy:  $\mu(t_1|L) = p = 1$  and  $\mu(t_1|R) = q = 0$
- SR2R: R: Best response is to play d|L, u|R.
- SR2S:  $t_1$  will not deviate as

$$u_{S}(L, d|t_{1}) = 1 > 0 = u_{S}(R, u|t_{1})$$

t<sub>2</sub> will not deviate as

$$u_{S}(R, u|t_{2}) = 1 > 0 = u_{S}(L, d|t_{2})$$

PBE: No deviation, thus, it's a PBE.

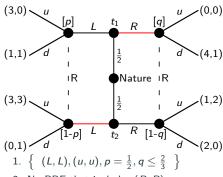

- 2. No PBE that includes (R, R).
- 3.  $\{ (L,R), (d,u), p=1, q=0 \}$

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

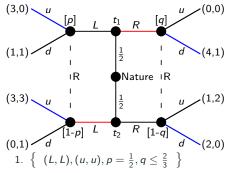

- Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S.
- Step 2: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S.
- Step 3: For the separating strategy (L,R), go over SR3, SR2R, and SR2S.
- Step 4: For the separating strategy (*R*,*L*), go over SR3, SR2R, and SR2S.

- 2. No PBE that includes (R, R).
- 3.  $\{(L,R),(d,u),p=1,q=0\}$

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

- Consider S's possible strategies:
  S<sub>S</sub> = {(L, L); (R, R); (L, R); (R, L)}
- Step 1: For the pooling strategy (L,L), go over SR3. SR2R. and SR2S.
- Step 2: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S.
- Step 3: For the separating strategy (L,R), go over SR3, SR2R, and SR2S.
- Step 4: For the separating strategy (R,L), go over SR3, SR2R, and SR2S:
  - SR3: R: Beliefs given S's eq. strategy:  $\mu(t_1|L)=p=0$  and  $\mu(t_1|R)=q=1$
- SR2R: R: Best response is to play u|L, d|R.
- SR2S:  $t_1$  will not deviate as  $u_{\rm S}(R,d|t_1)=4>3=u_{\rm S}(L,u|t_1)$   $t_2$  will not deviate as  $u_{\rm S}(L,u|t_2)=3>2=u_{\rm S}(R,d|t_2)$ 
  - PBE: No deviation, thus, it's a PBE.
- Step 5: Write up the full set of PBE.

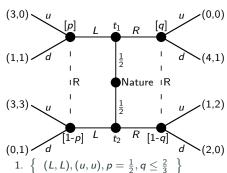

- 2. No PBE that includes (R, R).
- 3.  $\{ (L,R), (d,u), p=1, q=0 \}$
- 4.  $\{ (R, L), (u, d), p = 0, q = 1 \}$

Exercise 4.4.b in Gibbons (p. 248). Describe all the pure-strategy pooling and separating perfect Bayesian equilibria in the following signaling game.

Consider S's possible strategies:

$$S_S = \{(L, L); (R, R); (L, R); (R, L)\}$$

- Step 1: For the pooling strategy (L,L), go over SR3, SR2R, and SR2S.
- Step 2: For the pooling strategy (R,R), go over SR3, SR2R, and SR2S.
- Step 3: For the separating strategy (L,R), go over SR3. SR2R, and SR2S.
- Step 4: For the separating strategy (R,L), go over SR3, SR2R, and SR2S:
- Step 5: Write up the full set of PBE.

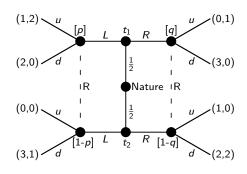

- 2. No PBE that includes (R, R).
- 3.  $\{(L,R),(d,u),p=1,q=0\}$
- 4.  $\{ (R, L), (u, d), p = 0, q = 1 \}$
- 5.  $\left\{ \begin{array}{l} (L,L), (u,u), p = \frac{1}{2}, q \le \frac{2}{3} \\ (L,R), (d,u), p = 1, q = 0 \\ (R,L), (u,d), p = 0, q = 1 \end{array} \right\}$

(pooling PBE)

PS11, Ex. 5: Signaling games

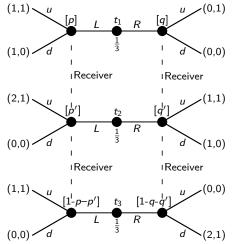

#### PS11, Ex. 5.a: Signaling games (pooling PBE)

Exercise 4.3.a in Gibbons (p. 246). Specify a pooling perfect Bayesian equilibria in which both Sender types play R in the following signaling game.

# PS11, Ex. 5.b: Signaling games (pooling PBE)

Exercise 4.3.b in Gibbons (p. 246). The following three-type signaling game begins with a move by nature, not shown in the tree, that yields one of the three types with equal probability Specify a pooling perfect Bayesian equilibria in which all three Sender types play L.

# PS11, Ex. 6: Spence's education signaling model (PBE)

#### PS11, Ex. 6: Spence's education signaling model (PBE)

Consider the following version of Spence's education signaling model, where a firm is hiring a worker. Workers are characterized by their type  $\theta$ , which measures their ability. There are two worker types:  $\theta \in \{\theta_L, \theta_H\}$ . Nature chooses the worker's type, with  $p_H = \mathbb{P}[\theta = \theta_H]$  and  $p_H = \mathbb{P}[\theta = \theta_H] = 1 - p_H$ .

The worker observes his own type, but the firm does not. The worker can choose his level of education:  $e \in \mathbb{R}^+$ . The cost to him of acquiring this education is  $c_\theta(e) = e/\theta$ . Education is observed by the firm, who then forms beliefs about the workers type:  $\mu(\theta|e)$ . We assume that the marginal productivity of a worker is equal to his ability and that the company is in competition such it pays the marginal productivity:  $w(e) = \mathbb{E}[\theta|e]$ . Thus, the payoff to a worker conditional on his type and education is  $u_\theta(e) = w(e) - c_\theta(e)$ . Suppose for this exercise that  $\theta_H = 3$  and  $\theta_L = 1$ .

- (a) Find a separating pure strategy Perfect Bayesian Equilibrium.
- (b) Find a pooling pure strategy Perfect Bayesian Equilibrium.
